

AT&T; Connected Spaces

AI Optimized Assisted Living SLA and Compliance Report

Site	Assisted Living Community - Maple Ridge
Reporting period	2026-03-01 06:51 UTC to 2026-03-02 06:08 UTC
Data source	CSV incident log with resident and caregiver activity events
Flow validation	Resident call -> caregiver acceptance -> resident confirmation -> caregiver confirmation

Overall Assessment

The dataset contains **19** resident assistance incidents. Overall SLA compliance is **100%**, with an average response time of **3.6 minutes** and an average total resolution time of **11.5 minutes**. Based on the observed flow completeness and timing, the facility is rated **Strong** with an overall operational risk level of **Moderate**.

Key operational signals include a pronounced morning demand peak, measurable differences between caregiver response patterns, and one resident cohort with materially higher call frequency and longer resolution intervals. The event chain remains fully traceable across the reporting period, supporting customer-facing compliance and audit discussions.

1. Total Assistance Calls per Resident per Day

Resident Name	Room	Avg Calls / Day	Total Calls
Mary Johnson	103	11.0	11
Alice Brown	101	5.0	5
John Smith	102	3.0	3

Observation: Mary Johnson generated the highest volume of assistance requests during the reporting period, indicating either elevated care intensity or repeated support requirements.

2. Average Response Times per Caregiver (SLA)

Caregiver Name	Avg Response Time	SLA Compliance	Handled Incidents
David Chen	3.2 min	100%	11
Maria Lopez	4.2 min	100%	8

Observation: David Chen shows the fastest average response time in the current dataset and represents a useful benchmark for consistent SLA-aligned workflow.

3. Average Total Resolution Time per Resident

Resident Name	Avg Resolution Time	# Incidents
John Smith	12.0 min	3

Resident Name	Avg Resolution Time	# Incidents
Alice Brown	11.8 min	5
Mary Johnson	11.3 min	11

Observation: John Smith required the longest average total resolution time, suggesting more complex assistance episodes or slower closeout completion.

4. Busiest Residents and Times of Day

Time of Day	Incident Count
Morning	6
Afternoon	2
Evening	5
Night	6

Observation: The highest call density occurred during the **morning** window (6 incidents). This pattern is consistent with routine care transitions and should inform shift coverage, escalation policy, and staffing optimization.

5. Individual Caregiver Performance

Caregiver Name	Average Response	Average Resolution	Compliance
David Chen	3.2 min	10.4 min	100%
Maria Lopez	4.2 min	13.1 min	100%

6. Proof of Compliance for State Surveys

Across the reporting window, **19 of 19** incidents contained a complete four-step event flow. This yields a documented compliance completion rate of **100%**.

Example compliant flow:

- Resident call pressed: 2026-03-01 06:51:00 UTC
- Caregiver accepted: 2026-03-01 06:57:00 UTC
- Resident confirmed resolution: 2026-03-01 07:04:00 UTC
- Caregiver confirmed resolution: 2026-03-01 07:05:00 UTC

Compliance Check	Status	Evidence
Explicit call acceptance step	Present	Every parsed incident includes caregiver acceptance after resident initiation
Two-step closure validation	Present	Resident and caregiver confirmation both recorded in each incident
Timestamp traceability	Present	All events are timestamped and sequenced chronologically

7. Two-Step Closure Validation

Two-step closure validation is present in **100%** of parsed incidents. This means the report can demonstrate both resident-side resolution acknowledgment and caregiver-side closure acknowledgment.

From a customer-facing perspective, this reduces ambiguity around whether assistance episodes were merely answered or fully resolved. From a compliance perspective, it strengthens the defensibility of closure records for internal review and state survey preparation.

8. Risk Scoring (0-100)

Resident risk scores prioritize residents with elevated call volume, slower response experience, incomplete incidents, or longer average resolution times.

Resident	Risk Score	Risk Level	Key Drivers
Mary Johnson	30	Low	high call frequency
John Smith	20	Low	long resolution time
Alice Brown	0	Low	stable pattern

Caregiver risk scores prioritize slower response behavior, lower compliance, slower resolution patterns, and high workload combined with SLA risk.

Caregiver	Risk Score	Risk Level	Key Drivers
Maria Lopez	50	Moderate	slower response, slower resolution
David Chen	0	Low	strong adherence

9. Staffing Optimization Recommendations Tied to Cost

This analysis applies a modeled caregiver labor cost of **\$25/hour** and compares baseline shift coverage against recommended coverage aligned to observed demand by time of day.

Shift	Current Coverage	Recommended Coverage	Cost Impact	Expected SLA Impact
Morning	1	1	+\$0/day	Maintains current performance
Afternoon	1	1	+\$0/day	Maintains current performance
Evening	1	1	+\$0/day	Maintains current performance
Night	1	1	+\$0/day	Maintains current performance

Primary recommendation: increase morning staffing coverage where demand concentration is highest. In this dataset, the morning period drives the greatest call volume, making it the most likely interval for queueing, delayed response, or inconsistent closeout if staff capacity remains flat.

Cost interpretation: adding one caregiver to a single 8-hour peak shift increases daily labor cost, but can materially improve responsiveness, reduce operational strain, and support stronger compliance posture. This tradeoff is often favorable in assisted living environments where documented responsiveness and resident safety directly affect satisfaction and survey outcomes.

10. Regulatory Mapping (California Title 22 - Operational Alignment)

The following mapping aligns the observed event patterns to operational expectations commonly associated with California Title 22 intent. This section is not a legal certification; it is a practical readiness view based on timestamped incident evidence.

Requirement Area	Status	Evidence
Prompt response to resident needs	Compliant	Average response time 3.6 min with 100% complete incident flow.
Adequate supervision and care responsiveness	At Risk	Demand concentration during the morning window suggests coverage sensitivity.
Documentation and audit readiness	Compliant	Full timestamp traceability across initiation, acceptance, resident confirmation, and caregiver confirmation.
Resident safety monitoring	At Risk	Higher-frequency residents and longer-resolution incidents should be reviewed for care plan adjustments.

Disclaimer: This analysis provides operational indicators aligned with Title 22 intent, but it is not a formal regulatory certification or legal opinion.

11. AI-Driven Recommendations

- Use peak-hour staffing overlays to increase caregiver availability during the highest-demand period rather than distributing labor evenly across all shifts.
- Set an internal response alert threshold at 5 minutes so emerging SLA drift is visible before it becomes a survey or resident-experience issue.

- Review the care plan for **Mary Johnson** to determine whether repeated call activity reflects a temporary pattern, a staffing gap, or sustained higher-acuity needs.
- Use **David Chen** as a workflow benchmark for acceptance speed and incident handling consistency.
- Maintain dual-confirmation closure policy because it materially improves defensibility for customer reporting, family confidence, and audit preparation.

Executive Takeaway

AT&T; Connected Spaces data shows that Assisted Living Community - Maple Ridge is operating with **strong** event completeness and strong traceability across the full resident-to-caregiver workflow. The largest improvement opportunity is not event capture - it is operational optimization during the busiest shift window. With modest staffing refinement, the site can improve response resilience, strengthen survey readiness, and deliver a clearer resident-service story to leadership, operators, and families.
